

Parts for Reach Stackers

Reach Stacker Parts - Lift trucks are utilized in practically all industrial construction sites and in warehouse operations and in boat yards. The reach feature of a lift truck is a vital part used in a variety of applications like for example when a shelving system is being used to stack pallets. A forklift operator will use the equipment's reach feature to grab pallets that could be placed on a top shelf and places harder to grasp.

Instructions

Turn the lift truck on and test yourself to get acquainted with the operating processes. Prior to picking up any stuff, become aware of how the machine turns, how fast the lift truck moves, how quickly the tines raise and drop and how fast the reach operates. Note whatever safety features which might come into play. Pay attention to how the machinery would slow down whenever the tines are up in the air.

Begin with lifting lighter stuff such as an empty pallet, so as to become comfortable with the reach function of the lift truck. Once the pallet is connected to the tines, tilt them back so the load could securely sit against the grate. This safety grate is positioned behind the blades and keeps the load from shifting. Set pallets down where desired by reversing the process. Tilt the blades down over the intended spot and level them. The pallets should effortlessly slide away from the safety grate. Set the pallets down.
