

Part for Boom Lift

Boom Lift Parts - Boom Lifts are a platform lift piece of equipment that could be raised or lowered to varying heights, making this apparatus a nifty tool for many industrial applications. There are many unique kinds of Boom Lift consisting of knuckle booms, scissor platform lifts, and aerial platform lifts, each functioning differently.

The regular aerial lift variation is regularly utilized at snowboarding lodges to transport people who are not comfortable with the ski lift. Effective in a manner similar to that of an elevator, snowboarders are transported up the mountain in stages, stopping at stations along the way until they access the apex. Aerial lifts are also used in construction, transporting personnel securely up and down the sides of multi-level building sites.

Scissor lifts are quite frequently used by service providers as the ideal method to securely enable workers to fix and work on cables and wires attached to poles. Phone, cable television and power companies have relied on the proficiency of this style of boom jack for years.

The knuckle boom lift is made for use within locations of uneven terrain and where the need to reverse course may be necessary. This type of boom jack has the ability to fit in tight spots where a scissor jack cannot fit. Working among multiple machines in a production plant or in close proximity between two walls, the knuckle boom also features a standard table equipped with rails for security and employee safety.

Based on the work requirements and the kind of work to be completed will establish the appropriate type of boom lift to opt for. Luckily, there is a model suitable for practically any function.
