

Forklift Fork Positioner

Forklift Fork Positioner - A fork positioner is an apparatus made out of top quality materials intended to be able to endure the most challenging operations and work environments. This particular piece of equipment could enable drivers to control the blades hydraulically without leaving the seat. Side shifting models have the added ability to be able to laterally position the entire load or the arms so as to facilitate much more exact carrying and placement in a quicker and more effective manner.

The blade pocket is somewhat unique and enables the operator to safely swing the forks into position without any worry of damaging the positioning cylinders. This could allow the driver the choice to execute simultaneous or independent fork movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be converted into fork positioners on existing units.
